

What do Nurses do? - an introduction to working in research

Presented by: Maudrian Burton

As Nurses we recruit people with no known illness; we followed this with work on specific disease themes, including difficult-to-study rare diseases. We bring people together and lead research to help scientific discoveries to move more quickly from the lab to the patient.

The children and adults who take part in Research are vital to the nurses role in medical research. They provide a sample and let the nurses access their health records to help Researchers understand disease.

We coordinate the samples, data and analysis that drive growing knowledge to take research from the bench to the bedside.

Our approach benefits patients: we have created a more efficient route for new treatments to reach the clinic.

The nurses approach also help the scientists and doctors to understand and treat the disease. The nurses collect smarter data and resources for their work.

In doing so, the nurses support them in their efforts to conduct better clinical research and trials. The nurses increase the chances of their success.
